A FIELD GUIDE FROM PERSEVERANT DIGITAL · FOR ESTATE SECURITY

The Cost-per-Client Tracking Map

Trace every lead from first click to paying client, find where data and money leak between your tools, and decide whether each fix is a setting, an integration or a small build.

THE SHORT ANSWER · 65 WORDS

REVIEWED OCTOBER 15, 20

Judge marketing by cost per client, not cost per lead. Map every stage from first clic to signed client, note which tool holds each stage, and test whether the lead's sourc survives the trip. Look for leaks in the handoffs between forms, phones, CRM and j or case software. Fix them with settings first, integrations second, and custom build only when the numbers justify it.

Why can’t you judge a channel by cost per lead?

Because a lead is not a client. One channel can produce cheap leads that never answer the phor Another can produce expensive leads that book, show up and sign. Stop measuring at the form fill and budget drifts toward the cheap channel while revenue stays flat.

The number that matters is cost per client, with cost per booked and held appointment close behind. Those numbers live in different tools: the ad platform, the form, the CRM, your system record. Nobody connects them by default.

Speed leaks too. Harvard Business Review’s 2011 audit of 2,241 US companies found only 37% responded to a web lead within an hour, and 23% never responded. A tracking map shows whe leads wait and where they disappear.

What this looks like for estate security firms

Your “client” is a signed engagement: an assessment, a design, a safe room or an ongoing program. Most inquiries come through architects, builders, estate managers or attorneys, and some through a principal’s staff searching quietly. Neither leaves a clean click trail, so a “who referred you” field, filled in by a person, is often your most important data point.

The sums are large. ASIS International reported in April 2025 that a professional threat assessment typically costs $25,000 to $50,000. A handful of clients can carry a year, and one misread channel can waste a year of spend.

Client names, addresses and property details never touch a marketing tool. Count consultation held and engagements signed by source, with no identifying detail, and move real relationship into a separate, access-controlled system.

Step 1: Draw your lead path and test it

Start on paper. Write down every stage a lead passes through, the tool that holds it and the pers who owns it. Many owners find a stage that lives in someone's inbox.

Stage	Tool	Owner	Source carried through? (yes / no / unsure)
First touch (referral from architect, builder or estate manager; search)			
Inquiry (call, form, email introduction)			
Private consultation booked			
Consultation or site visit held			
Won: engagement signed			

Every "no" or "unsure" is a leak. Past it, you cannot tell which channel deserves credit.

Now run the source test. Submit one test inquiry per channel, using a landing URL with UTM ta such as `?utm_source=google&utm_medium=cpc&utm_campaign=sourcetest` and a test nam you will recognize. Call each tracking number too. Then check where the source survives and delete the test records.

Channel	Date tested	Source in form tool?	Source in CRM?	Source in system of record?

For referrals, the test is a process check: does whoever takes the call record the referring partn the same way every time?

Step 2: Audit the tool stack

The goal is not cutting for its own sake. It is finding two tools doing one job, or an expensive too kept for one feature.

Tool	Monthly cost	What we actually use it for	Overlaps with	Who logs in weekly?	Keep / cut / replace

- [ ] Two tools that both send appointment reminders
- [ ] A full-tier platform used for one form or one email
- [ ] A scheduling link that books into a calendar but never into the CRM
- [ ] Former staff or vendors who still have logins

Annual cost ÷ features you use = cost per feature. The outliers go to the top of the review list. Never cancel a tool that holds client records until the data is exported and has a new home.

Step 3: Build the first three integrations

Fix leaks in order of how much revenue passes through them. Check settings before paying for anything.

1. Form plus UTM into the CRM. Capture UTM values and the landing page in hidden fields, mapped to source fields, not a notes box.

2. Call tracking into the CRM. Each call should create or update a record with the caller, the source and the time. Native connections are common; a webhook covers the rest.

3. Stage changes into reporting, and back to ad platforms where allowed. Booked, held and wo should flow to your monthly report. Where permitted, send them to Google or Meta as offline conversions so the platforms learn from clients, not form fills.

Keep it minimal: an anonymous “consultation held” event at most, with no names, email hashe or property details.

This is general information, not legal advice. When each integration goes live, confirm test lead show the right source, duplicates merge, and someone is alerted when it fails.

Step 4: Decide whether to build or buy

Most fixes are settings, some are integrations, and a few justify a small build. Score each 1 to 5.

Factor	1 (buy or skip)	5 (consider building)	Your score
How often the task happens	A few times a year	Daily	
Staff hours per month on it	Under 2	Over 20	
Fit of the current tool	Cheap and fits well	Costly and fits poorly	
How unique your process is	Standard	Specific to you	
Risk if it breaks	Touches client or sensitive data	Internal only	

Twenty or more is worth a closer look. Under 12, buy or change a setting.

(Monthly hours saved × loaded hourly cost) + software cost removed = monthly value. Build co ÷ monthly value = months to pay back.

Example numbers, not benchmarks. A coordinator spends 15 hours a month retyping inquiries int the system of record at $35 an hour: $525. If the integration also replaces a $150 add-on, monthl value is $675, and a $4,000 build pays back in about six months, before maintenance.

Good builds are small: intake routers, source syncs, quote estimators, proposal generators. Review request triggers must follow the FTC's 2024 rule: no incentives tied to positive sentimen and no review suppression (Morgan Lewis, August 26, 2024). And fundamentals come first. If leads wait two days for a reply, no tool fixes that.

Step 5: Keep a one-page monthly report

The map only helps if you look at it. One page, once a month, by source.

Source	Spend	Inquiries	Consultations booked	Held	Engagements signed	Revenue	Cost per engagemer
Google Ads							
Organic search							
Architects and builders							
Estate managers, attorneys and brokers							
Past clients							
Total							

Cost per client = spend ÷ won. Booking rate = booked ÷ leads. Show rate = held ÷ booked. Close rate = won ÷ held.

Read the rates before the totals. A weak booking rate usually points to speed or follow-up, a wea show rate to reminders, and a weak close rate to the consultation itself.

Where do most owners get stuck?

> **APIs and webhooks break silently.** A vendor renames a field or a token expires, and leads stop flowing with no visible error. Without monitoring, you find out weeks later from a gap in the report.

> **Knowing when not to build.** The right answer is often a setting you did not know existed, or a tool you already pay for. That is easier to see from outside your own stack.

> **Tracking and discretion pull in opposite directions.** Deciding exactly what the marketing side may know, and walling off the rest, takes a design most off-the-shelf tools do not offer.

If you want a second set of eyes on your map, book a 25-minute exploration call through the sh form at the end of this guide.
